

TARGETSCAN

Network assessment and service enumeration

DEMO - SYNTHETIC LAB DATA

Pinned address: 192.0.2.10

Synthetic sample; not a live scan

Assessment summary

Workflow: discovery, port scan, version detection, then enumeration of discovered services.

Scope: one pinned IP. Website results may describe a CDN or shared frontend; origin servers are not discovered. Versions and OS fingerprints are estimates, not confirmed vulnerabilities.

Stage	Status	Hosts recorded
05-enum-tcp-21	completed	1

1 rule-based findings. No numerical security score is assigned.

Failed, timed-out and unanswered checks are unknown. An empty finding list is not evidence that a target is secure.

Findings and next steps

Medium | Anonymous FTP login accepted

21/tcp

Anonymous FTP login allowed (FTP code 230)

Synthetic demonstration evidence only.

Recommendation: Review whether public access is intended and restrict permissions.

Scan scope

```
{  
  "scanner": "Python sockets; synthetic example"  
}
```

All resolved addresses (only the pinned address was scanned): 192.0.2.10

Service inventory and evidence

05-enum-tcp-21 | completed

Host status: up; reason: echo-reply

21/tcp | open | ftp

Example FTP 1.0

ftp-anon

Anonymous FTP login allowed (FTP code 230)
Synthetic demonstration evidence only.

Interpretation

open: listener detected. filtered: probes blocked or unanswered. timeout: unanswered or filtered; not proof of a closed port. Unknown services remain unknown; unsuccessful enumeration is inconclusive. TCP coverage is the selected port set. UDP and OS fingerprinting are not implemented. PDF script excerpts stop at 6000 characters; JSON retains collected evidence.
